

Job Description – BranchKey

Role: Front-End Owner/Developer

About us:

BranchKey is a Platform-as-a-service (PaaS) company. We build and provide the platform to enable massively collaborative machine learning at scale. Only through communication and distribution does the real value of machine learning become realised. Our company works to realise this goal by building a distribution platform for machine learning agents. We believe that accelerating machine learning deployment in industries such as healthcare, energy, agriculture, and financial services can quickly solve low-hanging problems, improving society, and lifting the bar for people to do more intrinsically rewarding work.

BranchKey is a fully remote company. This requires a decentralised working pattern and individual autonomy. If remote and autonomous work doesn't suit your style, this role may not suit you. We work 4 days a week with Friday's being your personal day to learn something new outside the normal role, leverage anyone on the team to transfer skills you want to learn.

Role Description:

BranchKey has a growing demand for users on our platform, to meet this need we are seeking to further develop our front-end web application. The web-application is the main interface for our users, so, we're building an application that is both feature rich and presents the user with a high-quality experience. Your responsibility will be ensuring this front-end experience from design to programming the functionality provides this service to the end-user. Being the front-end of the application, you will collaborate with the back-end through API's in a Back-end For Front-end (BFF) design pattern. As you develop the front-end it may become evident that new services are required to improve functionality. These services, their uses and basic implementation strategies must be well communicated to back-end engineers for implementation.

This role requires flexibility in tackling design, user-testing, and implementation.

What to expect from us:

- Autonomy in your role – decentralised responsibility and no micromanagement
- End-to-end ownership of the Front-end – from ideating to deployment
- Fun of early-stage startup development– develop your own way of working
- Minimal time from onboarding to developing for production
- Fast development cycles, minimise the paperwork and bureaucracy – build and deploy
- Young and ambitious team members who believe in making good products
- 4-day work week + Personal Learning Day to expand beyond normal role
- Flexible working hours – start and finish on your own time

Roles and Responsibilities:

- Work independently and take ownership of the front-end
- Identify areas of improvement for user services
- Ideate solutions with the team
- Execute implementation of FE functionality with back-end integrations
- Build integrated FE across service offerings
- Handle basic design challenges
- Collaborate on content and design strategies with design artists
- Manage deployment and monitoring pipelines for FE

Skills/Experience:

- Software Engineering
- Stack: Javascript, Nginx, Kubernetes, GitLab CI/CD
- Fluent English speaking and writing
- Strong communication abilities
- Remote working experience
- Ability to identify and create one's own work
- Software engineering cycles (Kanban / Scrum / Agile)
- Experience with engineering principles

Benefits:

- Salary competitive with Market rate
- Work equipment including work-from-home setup
- Frequent “work-cations” and team outings
